```
The invention discloses a polymucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel polypeptides. Also claimed its a polypeptide encoded by the polymucleotide or its partial peptide, an antibody binding to the polypeptide or peptide of the polymucleotide by consecting the polypeptide or peptide with the antibody of the encoded protein, and observing the binding between the two a transformant carrying the polymucleotide in an expressible manner and an antisense polymucleotide, or as a probe of the section as a primer for synthesiang the polymucleotide, or as a probe for detecting the polymucleotide. The oligonucleotide is useful as a primer for synthesiang the polymucleotide and encoded for detecting the polymucleotide. The polymucleotide and encoded is useful as pharmaceutical agents and marker or medicines for regulation of their expression and activity, or as targets of genes may be included in them, for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets of gene therapy. The genes are involved in tissue and/or cell respection. Membrane proteins, disease-related proteins, transcription-related proteins, disease-related proteins, transcription-related proteins, disease-related proteins and genes encoding them can be used as indicators for diseases (e.g. osteoporosis, neurological diseases, cancer, tunours. The cDNA may be used to regulate the activity or expression of the encoded protein to treat diseases. The sequence presented is a cDNA of the invention Note: Some of the sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office.

The invention discloses a polynucleotide comprising a sequence selected from 1970 fully defined nucleotide sequences which encode novel or its partial peptide, an antibody binding to the polypeptide or peptide or the polynucleotide, immunologically assaying the polypeptide or peptide or peptide by contacting the polypeptide or peptide or peptide by contacting the polypeptide or peptide or the polynucleotide by contacting the polypeptide or peptide or with the antibody of the encoded protein, and observing the binding or expressible manner and an antisense polynucleotide. The oligonucleotide is useful as a primer for synthesising the polynucleotide, or as a probe of or detecting the polynucleotide. The polynucleotide, or as a probe or suseful as pharmaceutical agents and encoded or proteins are useful as pharmaceutical agents and mand agence or genes may be included in them, for developing a diagnostic marker or medicines for regulation of their expression and activity, or as targets or genes are involved in tissue and/or cell or regeneration. Membrane proteins, disease-related proteins and expression of the encoded proteins and as a probe or concoding them can be used as indicators for diseases (e.g. osteoporosis, the activity or expression of the encoded protein to treat diseases. The concoding them can be used as indicators for diseases (e.g. osteoporosis, the activity or expression of the encoded protein to treat diseases. The sequence presented is not represented in the printed specification, but is based on sequence information supplied by the Buropean Patent Office.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ishii S;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TGTAAACAATGTAATAAAGTTTTCACTCGACCTTCAAAATTAGCACAACATAAATTAAAA 483
                                                                                                                                                                                                                                                                                                                 The invention relates to human nucleic acid associated proteins (NAAP) and their corresponding nucleic acid sequences. The invention is useful in diagnosing, treating and preventing diseases or conditions associated with the decreased expression or overexpression of NAAP, such as sociated proliferative (e.g. cancer, atherosclerosis), neurological (e.g. proliferative (e.g. disease, stroke), immune/inflammatory (e.g. AIDS, allergies) and developmental (e.g. Hypothyroidism, Cubiling's syndrome) disorders, or infections. It is also useful in assessing the effects of exceptions compounds on the expression of nucleic acid and amino acid sequences of NAAP. The NAAP or its fragments are useful in screening compounds for which acts as their agonist or antagonist. The microarray is useful in monitoring or measuring protein-protein interactions, and gene expression profiles. NAAP DNA is used in gene therapy. The present sequence is human NAAP CNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               7 GAAAGIGACGAAACCAAAICGAIAICAICTTIAAIAICIICTICTICAICAICACGICCC

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to novel human secretory or membrane proteins (ADAS4071) and their coding sequences (ADAS2433-ADAS4071). The coding sequences are useful in the gene therapy of diseases caused by abnormalities of the proteins, e.g. cancer, inflammatory diseases, osteoporosis or neurological disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 2230 BP, 831 A; 434 C; 400 G; 565 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to novel human secretory or membrane process (ADA5407). ADA55710) and their coding sequences (ADA5433-ADA54071). The coding sequences are useful in the gene therapy of diseases caused by abnormalities of the proteins, e.g. cancer, inflammatory diseases, osteoporosis or neurological disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ٠.

The invention relates to 971 novel human cDNA sequences (ADC29919-ADC 18099) and the polypeptides they encode (ADC30800-ADC31860). The ADC30800 human cDNAs. The invention additionally encompasses expression the novel human cDNAs. The invention additionally encompasses expression the novel human cDNAs. The invention additionally encompasses expression to be novel human cDNAs. The invention and encloded of the invention; an antibody against a polypeptide of the invention; and methods of polymertical conditions and methods of detecting polymertical conditions and methods of invention and methods of invention and methods of invention and methods of invention and methods of carrying a compound which bins to a polypeptide of the invention. The invention further discloses methods of peventing, treating or ameliorating a medical condition; kits comprising polymercial probes of invention methods for the onlymercial of compounds that modulate the appreciation or activity of the polymercial of compounds that modulate the expression or activity of the polymercial of compounds that modulate the expression or activity of the polymercial of compounds that modulate the expression or activity of the polymercial of compounds that modulate the expression or activity of the polymercial of compounds that modulate the expression or activity of the polymercial of compounds that modulate the expression of disporters or other traits, for assessing biodiversity, and in producing many other types of disease and other neurodegenerative diseases, anomia, platelet concern the nucleic acids may also be used to protein. The polymeric of also used for treatling diseases such as Parkinson's diseases or cancer. The nucleic acids may also be used of a protein. The polymeric of the invention of a protein. The sequence date for this patent did not form part of the printed specification, but was an electronic form that the requence of the invention of a protein or but wis patent did not form mat the requence of the printed specification, but we have treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or New polynucleotide and polypeptide useful for diagnosing, preventing or Weng G; Wang Z, Asundi V, Claim 1; SEQ ID NO 844; 1185pp; English. Ma Y, Drmanac RT; Wang D, WPI; 2003-371981/35. Ghosh M, Haley-Vicente D, P-PSDB; ADC31733

This GSS is part of a random genomic sequencing program of thirteen yeast species: Saccharomyces barnus var. uvarum, Saccharomyces

exiguus, Saccharomyces servazii, Zygosacharomyces rouxii,

Saccharomyces Kluyveromyces thermotolerans, Kluyveromyces lactis var. lactis, Kluyveromyces thermotolerans, Kluyveromyces lactis var. lactis, Rluyveromyces maxxianus var. marxianus, Pichia angusta. Debaryomyces hansenii var. hansenii, Pichia sorbitophila, Candida tropicalis and Yarromya lipolytica. Genomic inserts of 3 to 5 kb were prepared and both extremities were sequenced. See keywords for description of this sequence and for the sequence of the other extremity of this insert.

Consortium/LiML at: http://image.llnl.gov Series: IRAK Plate: 32 Row: f Column: 2 This clone was selected for full length sequencing because it passed the following selection criteria: Hexamer frequency ORF analysis, Similarity but not identity to protein
This clone has the following problem: frame shifted.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ,,

Clone distribution: MGC clone distribution information can be found through the I.M.A.G.E. Consortium/LLNL at: http://image.llnl.gov
Series: IRAK Plate: 70 Row: g Column: 16
This clone was selected for full length sequencing because it
passed the following selection criteria: Similarity but not
                                                                                                                                                                                        identity to protein
This clone has the following problem: retained intron.

New nucleic acid encoding Candida albicans transcription factor, useful e.g. in screening for antimycotic agents and for immunization.

Claim 12; Page 35-36; 45pp; French.

The present sequence represents a Candida albicans transcription factor, designated CATFILIA. The polypeptide is a DNA-binding protein, which is involved in initiating transcription of the ribosomal RNA 5S gene. The polymucleotide is used to screen for its specific inhibitors, potentially useful as antimycotic agents, to raise an antibody response that is protective against fungal infection and to raise antimycotics. Such antibodies, as well as the polypeptides and polynucleotides are used in

The invention relates to constructing (MI) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cone allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by recombination, of a promoter replacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter. (MI) is useful for constructing a strain of diploid fungal cells in which both alleles of a gene are modified. The diploid fungal cells having both alleles of a gene are modified. The diploid fungal cells having both alleles of a gene are modified. The diploid fungal cells having both alleles and/or pathogenicity of a fungus, a gene that is essential to the survival or growth of a fungus, a gene that contributes to the vivilence and/or pathogenicity of a fungus on antifungal agent that inhibits the growth of a fungus on antifungal agent that inhibits the growth of a fungus on antifungal activity of a gene product, preferably enzymatic activity, carbon disease. (MI) is useful for identifying a compound which modulates the compound extebolism, biosynthetic, transporter, transferiblional, transporter, biosynthetic, transporter, transferiblional, transduction, DNA replication and cell division activity. The method is useful for identifying a compound having the activity. The method is useful for identifying a compound having the activity. The method is useful for identifying a compound having the seemial Candida albicans protein used in the method of the invention.

Note: The sequence date for this parter is not represented in the printed specification but is based on sequence information supplied to Derwent by the bropsen patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              61 DCDKAFFRKSHLETHIVSHSEKKPFHCSVCGKGVNSRQHLKRHEITHTKSFKCTFENCQE 120

The invention relates to novel purified or isolated nucleic acids of essential genes of Aapergillus funigatus. The isolated nucleic acids of the invention are used to treat or prevent infectious by a pathogenic organism such as A. funigatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object by A. funigatus, or prevent or inhibit formation on a surface of a choistilm comprising A. funigatus. The polynucleotides are useful for expressing recombinant protein for characterisation, screening or therapeutic use, as markers for host tissues in which the pathogenic corganisms invade or reside, for comparing with the DNA sequence of A. funigatus to identify duplicated genes or paralogues having the same or corganism invade or reside, for comparing with the DNA sequence of A. funigatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA sequences of other related or distant pathogenic organisms to identify potential orthologous essential or virulence genes, for selecting and of expression patterns, for ratising anti-protein antibodies, as an expension of expression patterns, for ratising anti-protein antibodies, as an exter for cresponse, and for identifying polymucleotides encoding the other protein cuttingen to raise anti-DNA antibodies or to elicit another immune course or to identify inhibitors of the binding course or to identify inhibitors of the binding course or to identify inhibitors of the case or to cetermine levels of the protein in biological linds, as a marker for checking in which pathogenic organism invade or reside, and to electer correlative receptors or ligands in the case or virulence of acceptors. This sequence represents a processing in the easential genes or the seminary of another fundamental organisms.
                                                    Fungicide; cytostatic; essential gene; Aspergillus fumigatus; infection; cancer; contamination; biofilm; antibody; immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New purified or isolated nucleic acids of essential genes of Aspergillus fumigatus, useful for treating or preventing infections by A. fumigatus, or for treating a non-infectious disease in a subject e.g. cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Jiang B, Tishkoff D, Zamudio C, Eroshkin AM, Hu W, Lemieux SM;
Aspergillus fumigatus essential gene protein #313.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Disclosure, Page, 175pp, English,

New purified or isolated nucleic acids of essential genes of Aspergillus fumigatus, useful for treating or preventing infections by A. fumigatus, or for treating a non-infectious disease in a subject e.g. cancer.

Disclosure; Page; 175pp; English.

The invention relates to novel purified or isolated nucleic acids of the essential genes of Aspergillus fundatus. The isolated nucleic acids of the invention are used to treat or prevent infections by a pathogenic organism such as A. fundatus, to treat a non-infectious disease in a subject (e.g. cancer), to prevent or contain contamination of an object by A. fundatus, or to prevent or contain contamination of an object expressing recombinant protein for characterisation, screening or expressing recombinant protein for characterisation, screening or therapeutic use, as markers for host tissues in which the pathogenic organisms invade or reside, for comparing with the DNA sequence of A. fumigatus to identify duplicated genes or paralogues having the same or similar biochemical activity and/or function, for comparing with DNA sequences of other related or distant pathogenic organisms to identify potential orthologous essential or virulence genes, for selecting and

```
making oligomers for attachment to a nucleic acid array for examination of expression patterns, for raising anti-protein antibodies, as an antigen to raise anti-DNA antibodies or to elicit another immune response, and for identifying polymucleotides encoding the other protein with which binding occurs or to identify inhibitors of the binding interaction. The polypeptides may be used to raise antibodies or to determine levels of the protein in biological fluids, as a marker for host tissues in which pathogenic organism invade or reside, and to isolate correlative receptors or ligands in the case or virulence factors. This sequence represents a protein of one of the essential genes of Aspergillus fumigatus of the invention

The invention relates to isolated polymucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed crivity is useful in gene therapy techniques to restore normal crivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in issue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for generation end products dependent on DNA and and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in the way and the printed specification, but was obtained in the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      18.7%; Score 416.5; DB 4; Length 1212;

                                                                                                                                                                                                                                                                                                                                                        The invention relates to novel human secreted polypeptides. The polypeptides and antibodies to the polypeptides are useful for determining the present of or predisposition to a disease associated with altered levels of polypeptide. The polypeptides are also useful for identifying agents (agonists and artagonists) that bind to them. Cells expressing the proteins are useful for identifying a therapeutic agent for use in treatment of a pathology related to aberrant expression or physiological interactions of the polypeptide. Vectors comprising the proteins concluding the polypeptides and calls genetically engineered to express them are also useful for producing the proteins. The proteins are nutritional aupplements. They may be used to soliferation; to regulate haematopoiesis; and in bone, cartilage, tendon profession, as antitianglammatory agents; and in treatment of leukaemias. ANU29510-AAU3304 represent the amino acid sequences of novel human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              947 IGBKPYKCEECGKAFRKSSTLTEHKIIHTGEKPYKC--BECGKAFSQSSTLTRHTRWHTG 1004

encoded polypeptides (AAM)8642-AAM42213) with nootropic, decoded polypeptides (AAM)8642-AAM42213) with nootropic, minucosuppressant and cyrostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous injuries, peripheral nervous alcalised neuropathies and central nervous system diseases, such as alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as Immune system suppression, activity, chemotactic/chemokinetic activity, heamostatic and therapy, drug screening, assays for receptor activity, architics and inflammation, leukamenias and assays for receptor activity, arthritis and inflammation.

The invention describes a novel human isolated nucleic acid-associated polypeptide (NAAP). The polypeptides and polynucleotides are useful in diagnosing, treating and preventing diseases or conditions associated with the decreased expression or overexpression of NAAP, such as cell proliferative (e.g. cancer, atherosolarosis), neurological (e.g. proliferative (e.g. cancer, atherosolarosis), neurological (e.g. allergies) and developmental (e.g. Hypothyroidism, Cushing's syndrome) alsorders, or infections. These are also useful in assessing the effects of exogenous compounds on the expression of nucleic acid and amino acid sequences of NAAP. The NAAP or its fragments are useful in screening compounds for effectiveness as agonist or antagonist of the polypeptides, or in altering the expression of the target polynucleotide and compounds for in altering the expression of the activity of the polypeptide. The microarray is useful in monitoring or measuring protein-protein interactions, drug-target interactions, and gene expression profiles. This is the amino acid sequence of a novel human nucleic acid-associated
                                                                                  ď,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  SEKKPFHCSVCGKGVNSRQHLKRHEITHT--KSFKCTFENCQEAFYKHQSL-RHILSVH 136

```
htfill. The polypeptide is probabaly a DNA-binding protein probably involved in initiating transcription of the gene for ribosomal RNA 55 and mantaining the stability of transcription of other control genes. The htfillA polynucleotides and polypeptides are used to make therapeutic or diagnostic compositions for diseases associated with disorders of transcriptional control, particularly cancer or other inherited diseases. The htfillA polynucleotide can also be used to detect anomalies in gene transcription, particularly for diagnosis of inherited diseases, studying diseases involving htfillA
                                                                                                    Human, transcription factor, htfIIIA, DNA-binding protein, transcription, ribosomal RNA 5S gene; transcriptional control, cancer.

cancer-associated nucleic acid molecules (N) and proteins (P), where the cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have expostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate P expression. For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expression proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps. P. Additionally, N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. Additional to express the proteins. N and P carcinomas and cancers. Additional to the present invention. N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at the profession of the present for SEQ ID NO:1027
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               107
